Docs as code

Introduction

→ Docs as code is to integrate documentation in the software developement life cycle. ~~To~~ So that documentation does not lag behind the software developement.

Treating documentation like software code, using tools like [version control], [markup languages/markdown], and CI/CD pipelines ~~do~~ to keep documentation accurate and up-to-date.

[Written in markup languages > Store in Git managed through CI/CD]

Advantages
- → Consistent style and formatting
- → Version control
- → Track changes
- → [Collaboration] : Everyone has access to. Intended Developers will also have access.
- → Searchability
- → Documentation can be updated along with code updates.

Ch-2 Git → Distributed version control that tracks changes to files and enables collaborative software development. Access is distributed. It is a tool.

Git vs Git hub:

Git hub: Platform that host Git repositories online and provide addition tools. Git is a tool in your machine and hosted on your Git hub

(Hand to use) Basic commands: (Basicall to transfer files between your computer and git)

(Flow)

Git add: To add a file from working directory to staging area. (Preparation zone for commit)

↓

Git commit: To add all files that are staged to local repository. (Tracked by Git)

↓

Git push: To add all committed file from local repo to remote repo. (Every one with access to remote rep can see)

↓

Git fetch: from remote → local repo (X working directory)

↓

Git merge: from local → Working directory

↓

Git pull: from remote → working. (Git fetch + Git merge)

Git account:

email: ghosh89@avaya.com

pass: Winter@##@20#

→ Use powershell and ~~create username and email~~. We use GitHub username and email to configure Git

Flow: Install Git using .exe

↓

Git hub → create repo

↓

Use git hub email and username configure git using power shell

⇒ Git hub → code → Add file > upload > pull request.

~~Code~~

→ Git hub → Pull request → Merge pull request

↓

~~and cert~~ Confirm.

Markdown: Uses specific syntax to format text. for example, put one # for Heading level 1, two # for heading level 2.

→ for unordered list use : hyphen (-)

→ for ordered (number.) → metho

1. , 2. ,

→ Hyperlink : [Linktext] (URL)

→ Images : ![Alt text] (Link)

→ Code : `code text`

→ A code is more than one line : use triple back tick :

```
Line 1
Line 2
Line 3
```

Pull request : Submitting contribution.

Flow

① Branching : Taking copy of main code, Working on it and then can be merge with the main code

Git hub → master → view branch → new branch

Making changes : fixing.

Creating pull request : Request for merging the copy to main.

(4) Discussion and review: Team members can see the pull request and do discussion and the

(5) Approval and merging After review, the pull request is merged to main branch.

~~→ First need to~~

Flow for project:

~~Create~~ Create main folder

↓

invite / Add collaborator

↓

Merge pull request created by collaborator.

→ The collaborator: Adds a branch

↓

Opens the branch

↓

Add file / upload file

↓

Commit changes

↓

New Pull requests

↓

New pull request

↓

Create pull request (select reviewer)

: The reviewer

Click Review changes

↓

Approve → submit

↓

Merge pull request

Understanding workspaces and repo

Your computer → workspace

↓

Git on your computer → local repo (No internet required)

↓

Git repo on Git hub → remote repo
